

MEDIGO

Specification vs. System Conformance Report

What the three April 2026 pricing documents require, and what the platform actually does today

Prepared 31 August 2026

Codebase reviewed: Medigo-Backend · Medigo-Web-Booking · Medigo-BackOffice

1. Scope & Method

Three specification documents were compared line by line against the running system:

- **Medigo_Complete_Rate_Card.docx** — base rates, all surcharge families, the \$18 cap, dialysis and recurring rates.
- **Medigo_Cancellation_Policy_v2.docx** — the 15-cell cancellation/no-show fee matrix, revenue splits, and the developer implementation notes in §6.
- **Medigo_WAV_Stretcher_Developer_v2.docx** — WAV and stretcher rate components, commission and partnership splits, PSW Escort (Part 4) and the Hospital Discharge Package (Part 5).

Each requirement was traced to concrete code: the fare engine (payment-service), the ride lifecycle (ride-service), event consumers, database seeds and migrations, the rider booking web app, and the BackOffice admin console. A requirement is marked **BUILT** only when the code path that enforces it was found and read — not merely when the value exists in a config table.

Headline result: the pricing data model is essentially complete and correct; the enforcement layer around cancellations is not built at all, and two of the five service products in the documents do not exist.

2. Scorecard

Specification area	Status	Summary
Base rate structure (Rate Card §1)	BUILT	All values correct in the active rate card and applied by the fare engine.
Route rate tables (Rate Card §2)	BUILT	Stored per service type; engine reproduces the published totals.
Snow / rush hour / weekend / holiday / time-of-day surcharges (§3, 4, 6, 7)	BUILT	All amounts and windows match; stacking and the \$18 cap work.
Weather trigger automation (§3)	PARTIAL	Manual admin toggle only. No Environment Canada feed, no post-storm auto-expiry.
Highway 407 surcharge (§5)	PARTIAL	Amounts correct, but nothing in the booking flow ever sets it, and a config key mismatch can silently zero it.
Dialysis & recurring rates (§9)	PARTIAL	Per-trip rates applied. Eligibility rule, monthly packages and pre-authorised billing not built.
Cancellation & no-show fee matrix (Policy §2-5)	PARTIAL	All 15 fees stored, editable and displayed — but never charged.
Cancellation enforcement logic (Policy §6)	NOT BUILT	No window calculation, no charge, no no-show timer, no warnings, no waiver.
Cancellation revenue splits (80/20, 82/18, 50/50)	NOT BUILT	Stored as descriptive strings only; no money is moved.
WAV rate components (WAV §1.1)	PARTIAL	Rates correct; the \$45 minimum fare protection is applied at the wrong point.
WAV 18% vendor commission (WAV §1.3)	NOT BUILT	A single flat 20% platform fee is applied to every service type.
Stretcher rate components (WAV §2.1)	BUILT	Base \$85, \$2.25/km, \$35 attendant, \$1.00/min wait all correct.
Stretcher 50/50 partnership split (WAV §2.3)	NOT BUILT	Reference figures stored; no operating-cost deduction or net split in code.
PSW Escort service (WAV Part 4)	NOT BUILT	Not a bookable service; hourly pricing not implemented.
Hospital Discharge Package (WAV Part 5)	NOT BUILT	Exists only as an appointment-reason label, not as a bundled product.
Fee disclosure on receipts	PARTIAL	Accessibility and attendant fees are calculated and stored but omitted from the receipt.
Admin configurability (all docs)	BUILT	BackOffice covers fares, cancellation policy, commissions, ride types and pricing audit logs.

3. Critical Gaps

Ordered by business impact. Each is a requirement stated explicitly in a document that the system does not meet.

C1. Cancellation fees are never charged

Medigo_Cancellation_Policy_v2.docx §6 requires: "Fee collection: charged automatically to the client payment method on file." The complete fee matrix is present, correct and admin-editable — but no code reads it at cancellation time.

- cancel_ride (services/ride-service/app/services/ride_service.py:532) validates the status transition, writes cancelled_at and publishes RIDE_CANCELLED. It never reads the scheduled pickup time to determine the cancellation window, and never computes a fee.
- The payment-service listener for that event, RideCancelledConsumer (services/payment-service/app/events/consumers.py:73), only issues a refund of any payment already taken. It has no cancellation-fee path.

Consequence: every one of the fifteen fees — from the \$10 ambulatory tier to the \$85 stretcher no-show — is display-only. No revenue is collected and no driver, vendor or partner is compensated for a late cancellation.

C2. No-show handling has no timer, no confirmation prompt and no fee

The policy defines a no-show as the driver arriving and the client being absent after a 10-minute wait, with an in-app confirmation before the fee applies.

- NO_SHOW exists purely as a state transition from DRIVER_ARRIVED (services/ride-service/app/services/ride_state_machine.py:17). Nothing measures the 10-minute wait.
- No confirmation step is enforced before the status is set.
- payment-service subscribes to RIDE_COMPLETED and RIDE_CANCELLED only — there is no RIDE_NO_SHOW consumer, so a no-show produces no charge at all.

C3. WAV minimum fare protection is applied at the wrong point (revenue loss)

The WAV document states the \$45.00 floor applies to "base fare + accessibility fee combined". The engine instead applies it to the full one-way subtotal, after wait time, surcharges, the flat surcharge and the gateway fee have already been added.

```
services/payment-service/app/services/fare_service.py:275-277
    min_fare = rates["minimum_fare_protection"]
    if min_fare > 0 and one_way_subtotal < min_fare:
        one_way_subtotal = min_fare
```

Worked example — Milton Local, 8 km WAV, 10 billable wait minutes:

Step	Specification (WAV §1.2)	System today
Base + accessibility	\$22.00 + \$15.00 = \$37.00	\$22.00 + \$15.00 = \$37.00
Minimum fare protection	Applied → \$45.00	Not applied at this step
Wait time	+ \$8.00	+ \$8.00

Step	Specification (WAV §1.2)	System today
Surcharge + gateway	+ \$1.56	+ \$1.56
Subtotal before floor	—	\$46.56
Floor check	—	\$46.56 > \$45.00 → no top-up
TOTAL	\$54.56	\$46.56

Every short WAV trip is undercharged by up to \$8.00, and the shortfall is absorbed by the vendor, who is paid 82% of a smaller number. The floor must be applied to the base-plus-accessibility component before wait time and fees are added.

C4. One flat 20% commission is charged on every service type

The engine applies a single platform_fee_percent to all fares:

```
services/payment-service/app/services/fare_service.py:288-291
    platform_fee_pct = float(config.get("platform_fee_percent", 0.20))
    platform_fee = round(total_fare_raw * platform_fee_pct, 2)
    driver_earnings = round(total_fare - platform_fee, 2)
```

- WAV requires **18%** (WAV §1.3 and the Vendor Terms block). Vendors are currently over-charged two percentage points on every trip.
- Stretcher requires a **50/50 partnership split of net revenue after operating costs** (WAV §2.3). There is no operating-cost field, no net calculation and no two-party split anywhere in the payout path.
- The accessibility fee is specified as passed to the vendor in full; because commission is taken on the gross fare, 18% of it is currently retained.

The service_type_configs table already stores platform_commission: 0.18 for WAV and the 50/50 partnership flag for stretcher — the fare engine simply does not read them.

C5. Cancellation revenue splits are text, not logic

The who_receives column holds values such as driver_80_medigo_20, vendor_82_medigo_18 and partnership_50_50. These are stored, returned by the API and rendered in the admin console, but no code parses them into a disbursement. Since C1 means no fee is collected in the first place, the entire compensation chain the policy promises to drivers, WAV vendors and the stretcher partner is absent.

C6. PSW Escort (Part 4) is not built

The document instructs this to be built next sprint at \$38.00/hour with a one-hour minimum, then \$34.00/hour, billed separately from and in addition to the transport fare.

- RideType (libs/common/mediride_common/schemas/enums.py) offers only ambulatory, standard, wheelchair and stretcher. PSW cannot be booked.
- The fare estimate endpoint serves three service profiles only (standard, wheelchair_wav, stretcher).
- **Latent risk:** fare_service.py:25 already maps psw_caregiver to a service type, but the seeded PSW config holds standard_escort_hourly / additional_hours_hourly and no base_fare key. If a PSW ride ever reaches the engine it silently falls back to the \$12 ambulatory base and \$0.75/km — a wrong price rather than an error.

Note: this is distinct from the existing **Transport + Care Assistant** option, which the document says to leave as built. That flat \$35 fee is hardcoded as `DEFAULT_CARE_ASSISTANT_FEE` (`fare_service.py:28`) and works.

C7. Hospital Discharge Package (Part 5) is not built

The bundled stretcher + PSW escort + one hour of home support product, flat-priced at \$220–\$280, does not exist. The only occurrence of the term in the system is an *appointment-reason* label in the booking flow (`services/ride-service/app/api/v1/booking_flow_endpoints.py:127`), which describes why the trip is happening, not what is being sold. A `hospital_discharge` service-type config with the correct \$220–\$280 flat range is seeded and ready, but nothing consumes it, and there is no bundle upsell when a client selects stretcher.

4. Secondary Gaps

#	Requirement (source)	Current behaviour	Impact
S1	Push notification warning the client that cancelling now incurs a fee, sent when the driver goes En Route (Policy §6)	RIDE_DRIVER_EN_ROUTE is consumed and a generic "driver on the way" notification is sent. No fee wording exists anywhere in notification-service.	Clients are charged the dispatched-tier fee with no prior warning — a disputes and chargeback risk.
S2	Clear warning when cancelling a stretcher booking within 2 hours (Policy §6)	No such warning in the rider web app.	The \$55-\$85 tier is the highest in the system and is applied silently.
S3	One fee waiver per month for dialysis / recurring clients, as a configurable admin setting (Policy §6)	Present only as static explanatory copy in BackOffice CancellationPolicyPage. No counter, no admin flag, no approval workflow.	Waivers must be handled manually and off-system.
S4	In-app receipt for the cancellation fee (Policy §6)	No cancellation transaction type is created, so no receipt can be issued.	Follows from C1.
S5	Accessibility (\$15) and attendant (\$35) fees disclosed to the client (WAV §2 Terms)	Both are calculated and persisted on the fare breakdown, but ReceiptResponse (app/schemas/receipt.py) omits accessibility_fee, attendant_fee and care_assistant_fee.	A WAV or stretcher rider cannot see fees the document requires be disclosed. Amounts do not visibly reconcile to the total.
S6	Snow surcharge applied automatically on an Environment Canada advisory (Rate Card §3)	weather_conditions is an admin on/off table. No weather feed anywhere in the codebase; post-storm has no 24-hour auto-expiry.	Surcharges depend on someone remembering to toggle them, in both directions.
S7	Highway 407 use agreed with the client and reflected in the quoted fare (Rate Card §5)	use_highway_407 and highway_407_route exist end to end in the backend, but neither the rider web app nor BackOffice references them — nothing ever sets them.	The 407 surcharge can never be applied through the product as it stands.
S8	Highway 407 route keys	The active rate card uses milton_oakville / milton_brampton / milton_mississauga; the service-type config uses milton_to_oakville and so on. Lookup failure returns \$0 rather than raising.	A caller using the documented route naming gets a silent \$0 toll.
S9	Dialysis rate requires a minimum of 3 scheduled trips per week (Rate Card §9)	min_trips_per_week is seeded as 3 and never read. The discounted rate applies whenever the is_dialysis_trip flag is set on the booking.	The discount can be obtained without meeting the eligibility condition.
S10	Monthly packages (12 trips) with pre-authorised automatic billing (Rate Card §9)	ride_packages is a catalogue table with seeded prices. There is no enrolment or subscription record, no trip decrementing and no recurring charge.	The package rates (\$195-\$490) cannot be sold or billed.
S11	Dialysis clients: "24-hour cancellation notice required to avoid trip charge"	Follows from C1 — no charge exists.	Recurring no-shows carry no consequence.

5. Points Needing Business Sign-off

These are not defects. They are places where the documents are silent or internally inconsistent, and where the code has already committed to one reading. Each should be confirmed before the April 2026 launch.

#	Question	What the code assumes today
A1	Is the Highway 407 toll inside the \$18.00 maximum surcharge cap? Part 3 of the WAV document lists the 407 among "Surcharges — apply to all three services", immediately above the line stating the \$18 cap applies to all service types.	Excluded from the cap and treated as a pass-through cost (fare_service.py:231-238). On a Friday-evening trip in heavy snow via the 407 this is a real difference in what the client pays.
A2	The peak example in Rate Card §8 states the uncapped total would be \$63.06, but the itemised surcharges (\$5 + \$5 + \$8) sum to exactly \$18.00, which makes the capped and uncapped totals both \$51.06. \$12.00 is unexplained.	The engine reproduces \$51.06. The stated \$63.06 cannot be derived from the line items given.
A3	In the route tables, wait charges such as "\$1.00 (2 min)" imply billing from the first minute, which contradicts the "first 10 minutes FREE" rule stated directly above them. Rate Card §8 resolves this by writing "15 min billable".	The minutes shown in the route tables are read as <i>billable</i> minutes, i.e. after the free 10. Worth stating explicitly in the documents so client-facing quotes are not built on the other reading.
A4	Round trips are not priced anywhere in the three documents, but the product supports them.	The return leg adds the base fare and distance charge again, and does not re-apply the accessibility fee, the attendant fee or the minimum fare protection (fare_service.py:280-286). Needs confirmation, particularly for stretcher, where two crew are deployed for both legs.
A5	Does the dialysis rate replace the whole fare or only the base and distance component?	It replaces base fare and distance only; wait time, the \$0.06 surcharge, the \$1.50 gateway fee and any applicable surcharges are still added on top. This is consistent with "peak surcharges apply on top of dialysis rates" but produces a total above the published rate (e.g. Georgetown \$18.00 becomes \$19.56 before wait time).
A6	What evidence qualifies for the monthly waiver, who approves it, and does it reset on the calendar month or a rolling 30 days?	Not implemented — see S3. The rule cannot be built without these three answers.

6. What Is Already Correct

For balance, and to avoid rework: the following were verified against the documents value by value and need no change.

Pricing data and the fare engine

- **Base rate structure:** \$12.00 flat under 10 km, \$0.75/km beyond, \$0.06 surcharge, \$1.50 insurance & gateway, first 10 wait minutes free then \$0.50/min, \$18.00 cap — all present in the active rate card (payment-service migration 003) and applied in order by the fare engine.
- **Every surcharge family matches exactly:** snow \$3/\$5/\$3; morning rush \$4 Mon–Fri 07:00–09:00; evening rush \$4 Mon–Thu 16:00–18:30; Friday evening \$5 16:00–19:00; Saturday \$3, Sunday \$4, Ontario holidays \$5; early morning \$5, late night \$4, overnight \$8. Stacking and the \$18 cap behave as specified.
- **Highway 407 amounts** \$8 / \$9 / \$10 by route are correct (subject to S7 and S8).
- **WAV rate components:** \$22.00 base, \$1.10/km, \$15.00 accessibility fee, \$0.80/min wait, \$45.00 floor value — all correct (subject to C3 on *where* the floor is applied).
- **Stretcher rate components:** \$85.00 base, \$2.25/km, \$35.00 mandatory attendant fee, \$1.00/min wait — all correct. Spot-checked against the published route table: Georgetown $\$85 + 8 \text{ km} \times \$2.25 = \$103.00$; Mississauga $\$85 + 35 \text{ km} \times \$2.25 = \$163.75$. Both match.
- **All fifteen cancellation and no-show fees** are stored with the correct amounts and split descriptions (migration 007), including the corrections away from the earlier incorrect values.
- **Dialysis rates:** per-trip (\$18 / \$28 / \$32 / \$45) and monthly package (\$195 / \$300 / \$345 / \$490) are seeded for all four Milton routes.
- **Published route pricing tables** for all three tiers are stored per service type and reproduced by the engine.
- **Audit trail:** the fare breakdown persisted per ride captures distance, wait time, itemised surcharges, the capped total, the 407 toll, accessibility, attendant and care-assistant fees, dialysis flag and rate card version.

Admin console

- BackOffice covers fare configuration, pricing configuration, the cancellation policy matrix, ride types, commission settings, recurring packages, pricing change logs and a pricing dashboard. The configuration surface the documents call for is in place — it is the enforcement behind it that is missing.

7. Recommended Order of Work

Priority	Item	Why this order
1	C3 — move the WAV minimum fare protection to base + accessibility fee	A few lines of code, immediate revenue correction, no product or business decisions required.
2	C4 — per-service-type commission (18% WAV, 50/50 stretcher net)	Contractual obligation to vendors and the stretcher partner. The configuration already exists; only the engine needs to read it.

Priority	Item	Why this order
3	C1 + C5 — cancellation fee calculation, charging and splits	The largest single gap, and the whole point of the cancellation policy document. Depends on the fee matrix, which is already correct and needs no changes.
4	C2 + S1 + S2 — no-show timer with driver confirmation, En Route fee warning, stretcher 2-hour warning	These make the fees in item 3 defensible against disputes. Building the charge without the warnings invites chargebacks.
5	S5 — itemise accessibility, attendant and care-assistant fees on receipts	Small change; satisfies the WAV and stretcher disclosure requirements and makes totals reconcile.
6	C6 — PSW Escort at \$38/hr (1 hour minimum), then \$34/hr	Explicitly the next sprint in the document. Needs a new ride type, hourly pricing in the engine, and separate billing from the transport fare.
7	S3 — the monthly waiver, once A6 is answered	Blocked on a business decision, not on engineering.
8	S9 + S10 — dialysis eligibility enforcement and monthly package billing	Unlocks the package rates as sellable products.
9	S7 + S8 — surface Highway 407 in the booking flow with client agreement, and unify the route keys	The surcharge is unreachable until this is done.
10	C7 — Hospital Discharge Package as a bundle upsell on stretcher	The document marks it a future release. Build it as a flat \$220-\$280 price, never derived from the PSW hourly rate.
11	S6 — Environment Canada weather trigger	An operational improvement over the manual toggle, which is functional in the meantime.
